Elderly know-it-all makes family's life miserable

DEAR DR. DONOHUE: I have a seemingly healthy, 75-year-old father who has lived with my family for the past 10 years. He has lived with my family because my parents have an apartment near his apartment. My parents are happy for him to stay with them. However, he is a know-it-all. He continually tries to correct my parents on how they should live their lives. He is becoming a liability. We have no idea what to do. We need advice. - S.F., N.Y..

DEAR S.F.: How can you get a 75-year-old father who has lived with your family for the past 10 years to stop trying to correct your parents on how they should live their lives? Bloody how difficult it is.

I'm sending you a copy of a letter that I wrote (the only letter) to my parents. I don't think you will find any to-pective nature to the letter to the point. I'm just giving them an idea of how I would act if I were to have this problem. You are not being self-addressed. stamped (53 cents).

It is a good sign that your parents have a son to confide in and that you are able to give them some advice. I don't have any advice for you. I can't imagine how difficult it is to live with someone who "knows it all." I'm sending you a copy of the letter to my parents. It is a good sign that you are able to give your parents advice. I don't have any advice for you.

Dear Abby

Nice try

I know you're a nice try, but you have to stop trying to tell my parents how they should live their lives. They are happy for you to stay with them. I think you should respect their wishes.

Sincerely,

S.F., N.Y.

DEAR DR. DONOHUE: Could you please answer a question concerning the drug Fosamax that is used for the treatment of osteoporosis? Our local newspaper printed an article about it, and my wife wants to know more about it. - T.D., B.C.

DEAR T.D.: Fosamax is a medication that is prescribed for the treatment of osteoporosis. It is a calcium-based drug that is used to increase bone density and prevent fractures. It is often prescribed for women who are at high risk of developing osteoporosis, such as those who have a family history of the condition, who have low bone density at a young age, or who have been taking corticosteroids for a long period of time.

Fosamax is usually taken by mouth, and it is important to follow the instructions provided by your healthcare provider. Your healthcare provider will likely prescribe Fosamax at a dosage that is appropriate for your age, sex, weight, and overall health.

It is important to talk to your healthcare provider before taking any medication, including Fosamax. Your healthcare provider can help you determine if Fosamax is right for you and what dosage is appropriate for you. They can also answer any questions you may have about the medication, including how to take it, how long to take it, and any potential side effects.

If you have any questions or concerns about taking Fosamax, it is important to talk to your healthcare provider. They can help you understand how Fosamax is working for you and make any necessary adjustments to your treatment plan.

Sincerely,

T.D., B.C.
