SHELTER BUDDING IS AN EASY OPERATION.

One Way in Which Fruit Trees Are Propagated.

The simplest form of budding is that of directly planting the buds. This may be done at any time of the year, provided the material is kept moist and shaded. A horizontal or a vertical bud is preferable. The latter is a good form of budding, as it is easier to transplant and to work with a bud. A bud is inserted in the same way as a seedling, by the use of a stake and a short piece of cane. The bud is then covered with soil and watered well. The stake is removed in a few weeks, and the plant is transplanted to its permanent position.

The blader of the budding tool is hard, and must be kept sharp. A blader should be inserted in the tool, and the blade must be sharpened before use.

GOOD ROADS AND BAD ONES.

Mr. W. M. Groves, Special Correspondent.

We have been told by some of our friends that the road to the farm is the most important thing in the success of a farm. In many cases it is true. If the road to a farm is good, it will enable the farmer to make a larger profit. It is also true that the road to a farm is the most important thing in the success of a farm. If the road to a farm is bad, it will enable the farmer to make a smaller profit.

THE PAINTING BUSINESS.

Good results are obtained by the use of watercolors, as they are easy to work with. The paints can be made by mixing the colors of the soil with the proper amount of water, and using them immediately. The colors are best when they are freshly mixed. The paints can be kept for a long time if they are stored in a cool place.

FEED FOR SEASON.

The experience of the past season has shown that the best results are obtained by feeding the sheep with the proper amount of food. The feeding of the sheep is best done by feeding them two or three times a day, and by feeding them the proper amount of food each time. The feeding of the sheep is best done in the spring and summer, as the animals are most active during these times.

HUMUS IN THE SOIL.

The importance of humus in the soil is frequently overlooked. The soil is the basis of all life, and the increase of humus in the soil is the basis of all growth. The increase of humus in the soil is best done by the addition of compost or manure to the soil. The compost or manure should be well mixed with the soil before it is added.
